ADDITIONAL INFORMATION

- Values obtained with different assay methods or kits may be different and cannot be used interchangeably.
- Test results cannot be interpreted as absolute evidence for the presence or absence of malignant disease.
- The testing method is an electrochemiluminescence assay manufactured by Roche Diagnostics Inc. and performed on the Cobas system.
- The risk of ovarian malignancy algorithm (ROMA) score should not be used without an independent clinical/radiological evaluation and is not intended to determine whether a patient should proceed to surgery. A low-likelihood ROMA result in the setting of a positive initial cancer risk assessment should not preclude/prevent an oncology referral.
- Serum markers are not specific for malignancy and values may vary by method. Values obtained with different assay methods cannot be used interchangeably.
- The use of these cut-points provides a 75% specificity and sensitivity of 84% in patients with stage I-IV epithelial ovarian cancer.
